LAB 21 — INSTRUCTIONS

Expose a Flow over HTTP with a JSON Schema

Topic 05 · Day 5 · Intermediate · Power Automate, HTTP, JSON · Alignment K5 · A4

Goal

The learner builds a flow with an HTTP request trigger, defines the request body with a JSON schema, returns a structured response, and calls it from outside Power Automate to prove the integration works.

What you will build

An HTTP-triggered flow with a defined request schema and a structured JSON response

Files supplied in this folder

- Lumina-Living-Lab-21.xlsx — Endpoint contract and test-call workbook
- Request-Schema.json — Sample request body used to generate the schema

Primary prompt

> *Explain how the When an HTTP request is received trigger works in Power Automate: where the URL comes from, why a JSON schema is needed, and how the Response action returns data to the caller.*

Detailed procedure

Step 1. Create a flow with an HTTP request trigger

Create an instant cloud flow and choose When an HTTP request is received. The trigger generates its own URL, which is the endpoint external systems call.

Step 2. Define the request body JSON schema

Use Generate from sample and paste a representative request. The schema is the contract that tells the flow what fields to expect and makes them available as dynamic content.

Step 3. Understand why the URL is a secret

The generated URL contains a signature that authorises the call. Anyone who has the URL can trigger the flow, so treat it like a credential.

Step 4. Add the processing steps

Use the parsed fields from the trigger to do the work — for this lab, validate the request and look up a result.

Step 5. Add a Response action

Return a status code and a JSON body. Without a Response action the caller receives only an acknowledgement, not a result.

Step 6. Save and copy the endpoint URL

The URL is only generated once the flow is saved. Record it in the workbook rather than in a shared chat.

Step 7. Call the endpoint from outside and inspect the run

Send a test request with the documented body, then confirm the run history shows the received payload and the returned response.

Acceptance test

An external call with a valid body returns the expected JSON response, and the run history shows the parsed fields exactly as the schema defined them.

Evidence to retain

The request and response pair, plus the run history showing the received payload.
