LAB 23 — INSTRUCTIONS

Add a Human Review Gate to an Agent Action

Topic 05 · Day 5 · Advanced · Copilot Studio, Power Automate, Teams Approvals · Alignment K5 · A7

Goal

The learner takes an agent that can trigger a consequential action and inserts an approval gate, so the model may propose the action but only a named person can release it.

What you will build

An agent whose consequential action is suspended until a named person approves it

Files supplied in this folder

- Lumina-Living-Lab-23.xlsx — Boundary-of-agency and approval-test workbook

Primary prompt

> *Review this proposed action and summarise for the approver: what is being requested, the amount, the vendor, which policy rule applies and what your recommendation is. Present it as a decision, not as a completed action.*

Detailed procedure

Step 1. Identify the consequential action

Decide which single step in the process would be expensive or embarrassing to get wrong. That is the step that needs the gate.

Step 2. Rank the controls honestly

A control the model cannot reach beats a rule you asked it to follow, and neither is the same as a name someone typed into a text box.

Step 3. Insert an approval before the action

In the agent flow, place a Start and wait for an approval action before the step that has real effect.

Step 4. Send the approval to Microsoft Teams

Route the approval to Teams so the approver receives it where they work and the decision is recorded against them.

Step 5. Give the approver enough to decide

Include the request, the amount, the applicable rule and the recommendation, so approving does not require a separate investigation.

Step 6. Write an audit row regardless of the outcome

Log every request, approved or rejected, so the record does not depend on the decision that was made.

Step 7. Test an approval, a rejection and an edge case

Include a case the agent would plausibly get wrong, and confirm the gate stops it even when the agent's reasoning looked sound.

Acceptance test

The consequential action never completes without a recorded approval, a rejection stops it cleanly, and an audit row exists for every request regardless of outcome.

Evidence to retain

Approval and rejection run histories, the Teams approval cards and the audit log rows.
